SUMMARY

M.S. Data Science student at Arizona State University with a B.Tech. in Artificial Intelligence and Machine Learning. Builds reproducible ML and analytics systems across model reliability, forecasting, retrieval, computer vision, data quality, reporting automation, and explainable cybersecurity. Seeking data science and AI/ML internships and early-career roles.

EDUCATION

Arizona State University - M.S. Data Science, Analytics and Engineering | GPA: 3.5/4.0 | Expected May 2027 | Tempe, AZ

Anurag University - B.Tech. Artificial Intelligence and Machine Learning | CGPA: 3.75/4.0 | May 2025 | Hyderabad, India

EXPERIENCE

Research Assistant, Data Visualization - Arizona State University | 2025-Present

- Build research-facing analytics and visual summaries with D3.js, Tableau, and Power BI; translate open-ended faculty questions into structured analysis and actionable next steps.
- Communicate findings, assumptions, and technical tradeoffs to research stakeholders.

Data Intern - Open Pixel | May 2024-June 2025

- Prepared, validated, and analyzed operational data with Python and SQL for recurring reporting.
- Built repeatable reporting workflows and dashboards with explicit metric definitions and validation checks; collaborated with stakeholders to improve output consistency and usability.

SELECTED PROJECTS

Model Reliability Lab | Python, scikit-learn, calibration, drift monitoring

- Compared calibrated logistic regression with random forest using isolated train, validation, and test partitions; added cost-aware thresholding, cohort checks, permutation importance, and simulated drift.
- Achieved 0.984 average precision and 0.0445 Brier score on a 114-row held-out partition with eight automated tests.

Demand Forecasting Backtest | Python, pandas, gradient boosting, time series

- Built past-only lag/rolling features, chronological splits, three expanding-window folds, a seasonal baseline, and validation-calibrated prediction intervals.
- Reached 4.25% WAPE versus 8.62% for the generated-data baseline, a 50.7% relative improvement, with eight automated tests.

CyberGuard Zero Trust Classifier | Python, Flask, explainable rules

- Developed deterministic event classification, 0-100 risk scoring, traceable reasons, and mappings to selected Zero Trust and NIST control families.
- Verified parsing, rules, bounded APIs, CLI behavior, and scoring with 45 tests and a deterministic 5,000-event scale check.

TECHNICAL SKILLS

Programming and analysis: Python, SQL, R, pandas, NumPy, statistical analysis, feature engineering

Machine learning: scikit-learn, PyTorch, TensorFlow, classification, anomaly detection, forecasting, calibration, embeddings, NLP, computer vision

Systems and visualization: Flask, REST APIs, Git/GitHub, Docker, Power BI, Tableau, D3.js, Excel, Jupyter
